Cooper, Stephen V. and Robert L. DeVelice. 1995. Matrix of plant community/association types by state and global rank and occurrence by Bureau of Land Management Resource Areas: with forward explaining compilation and use of matrix. Montana Natural Heritage Program. Helena, MT. 46 pp.

**ABSTRACT**

Within the state of Montana at least 400 plant associations or plant community types have been catalogued. The Bureau of Land Management has vast acreages under its aegis; the various Resource Areas (R.A.) represented have widely varying climates, substrates and landscapes. Because community types are good biological integrators of the above listed variables, an easily comprehended measure of the differences and similarities between these areas can be appreciated from a matrix of community types by R.A. In addition this matrix can provide an easily accessible geographically keyed listing of communities critical to conservation measures.

**FORWARD TO MATRIX OF PLANT COMMUNITIES/ASSOCIATIONS  
ON BUREAU of LAND MANAGEMENT HOLDINGS:  
BY CONSERVATION RANK AND RESOURCE AREA**

To assess community type distribution by Bureau of Land Management Resource Area (R.A.) the initial approach was to query the Biological Conservation Database (BCD). This database, as currently constituted and maintained on MTNHP computer system, contains only high quality (near pristine, lightly grazed) representations of c.ts. Only 125 plots were found in database that actually were on BLM lands (0 on Garnet, 0 on Great Falls, 2 on Powder River, 3 on Big Dry, 5 on Judith, 13 on Billings, 14 on Headwaters, 16 on Valley, 20 on Havre, 26 on Phillips and Dillon). Another query of BCD with records for counties aggregated into Resource Areas (because Resource Areas is not a field that can be queried in BCD) yielded only an additional 28 plots. Counties with no, or very minimal BLM lands were not queried; see Table 3 (page vii for listing of counties queried and those with dual Resource Area membership).

This meager total would not begin to reveal the diversity of c.ts. on BLM holdings so further inquiry was made. However, it cannot be stated unequivocally that the c.ts. cited for particular resource areas actually occur on BLM holdings. We have only surmised that c.ts. documented to be within the jurisdictional boundaries of particular R.As. occur in environments that would also be found on BLM lands.

We then mounted back-up discs of lower quality site records once purged from the BCD system and derived locations for an additional 234 types.

A manual search then ensued which involved the perusal of the scientific literature and field and clearance reports that BCD indicated had been an original source of community description. This was complemented by a scan of the Montana Riparian Association stream reach inventory reports to the BLM (and other agencies with holdings proximal to those of the BLM). A scan of these inventory reports for stream reaches was deemed more efficient and more inclusive as much more acreage was evaluated than was covered when field plots were established (during sampling for ad database on which to construct a wetlands classification.

There are a number of types listed for which we have no plot documentation at this time; such would be the case for several riparian/wetland types named by the Montana Riparian Association in the course of inventorying Bureau of Land Management lands as per contractual stipulations. Other community types have been described by well-known ecologists (e.g. W. Mueggler and W.

Stewart) but no sample plots exist to document the existence of the type; these community types have been entered into our database on the strength of the observers' reputations in ecological matters. Still other community type information remains only on field forms and is yet to receive comprehensive analysis, but again based on the excellent reputations of investigators (such as R. DeVelice and P. Lesica) the preliminary community type designations based on these not yet analyzed field records have been incorporated into this matrix. Note that c.ts. derived from incompletely analyzed data tend to be grouped in the last portion of the matrix labeled "OTHER."

The 19 page table that precedes the c.t./rank by R.A. matrix is an alphabetical listing of community types and UNESCO structural types (a hierarchical classification of vegetation types) and is meant as a convenience for entering the matrix. Following c.t. name is the page number of matrix on which particular c.ts./structural types occur and the BCD source of the most definitive information on that vegetation type (UNESCO structural types do not have citations!).

The c.t./rank by R.A. matrix is organized by the UNESCO structural/physiognomic system so as to confer some ecological meaning to the whole. The UNESCO system is composed of four levels (Class, Subclass, Group, Formation). Headings of important group separations, which are in bold typeface, proceed from environments dominated by macrophytes (trees) to progressively reduced lifeform and more sparse vegetation types, or at least those of rather restricted environments (alpine rockfields, aquatic substrates). Thus, all c.ts. recognized as mid-grass prairie (dominated by species of Agropyron, Stipa, Poa etc.) occur together, as well as their subdivision into mid-grass types with and without a significant representation of a shrub component. Within a UNESCO structural unit the vegetation types are arranged alphabetically by Alliance and plant association, which are the finest levels of the classification and floristically defined.

Regarding the state and global ranking, note that only vegetation types which are known or presumed to be represented on BLM lands have their rankings reported. **The lack of state or global rank signals that either that type does not occur on BLM lands or that we lack sufficient information to make the call.** The rankings are estimates of the state and global rarity, respectively, for that type. These ranking have been determined by MTNHP staff in coordination with The Nature Conservancy and professional ecologists in Montana.

The shading of rows indicates that the state ranking is numerically 3 or less; this shading is intended as a convenience for spotting types potentially at risk. Note that some community

types have a question mark for rank; this indicates that that these types are relatively new and have no ranking to date and/or that their extent/ubiquity is simply unknown. Table 1 (page vi) presents a matrix used by Natural Heritage Programs and which roughly details how rankings are determined with respect to occurrence and areal extent. A ranking of 3 indicates communities currently with a healthy status but with some negative impact could become imperiled. Communities with rank of 3 or less are those that should be tracked in any conservation program.

The cells of the matrix (occurrence of c.t./p.a. by R.A.) are either left blank (underline character holding position), indicating either no information or lack of occurrence, or contain one of three symbols. S indicates that a sample (plot) or inventory sighting has been taken within the particular R.A. for the indicated vegetation type; it does not imply that the sample had been taken on BLM lands. The symbol P stands for probable occurrence within R.A. based on presence of that c.t. in an adjacent R.A. and the fact that this adjacent R.A. has substrates/environments inferred to be like those of the R.A. supporting the c.t. The H stands for hypothetical, a degree more uncertain than P ; we suspect the c.t. could exist there based on putative species distribution. The P and H designations are just educated guesses of experienced ecologists.

Table 2 (page vii) is a synopsis of state rankings (numerical values 3 and less) by Resource Area and total number of community types by Resource Area. Note that only cells with S values (see below) and with both S and P values have been tabulated so a comparison can be made between actual and hypothesized occurrences.

The compilation that follows (beginning on page ix) is an alphabetical listing by scientific name (latin binomials) of all plant communities (C.T.), associations (P.A.) and habitat types (H.Ts.) listed for Montana by the Montana Natural Heritage Program. This listing has been updated and is considered all-inclusive as of 12/1994.

Table 1. Matrix used as guide in estimation of state community type ranking. A combination of estimated total area occupied and estimated number of occurrences is used to define ranges for specific S-rankings (cells of table). Rankings in parenthesis are values that can be given when a community is at extremes of the cell's parameters.

Estimated Number of Occurrences		Estimated Total Area (mi <sup>2</sup> , acres)			
		3 mi. <sup>2</sup> <2,000 ac.	3-15 mi. <sup>2</sup> 2,000 to 10,000 ac.	15-75 mi. <sup>2</sup> 10,000 to 50,000 ac.	>75 mi. <sup>2</sup> >50,000
0	SH, SX	-	-	-	-
A 1-5	-	S1	S1	S1	S1
B 6-20	-	S1	S2 (S1)	S2 (S1)	S2 (S1)
C 21-100	-	S1	S2 (S1)	S3 (S2)	S3 (S2)
D 100+	-	S1	S2 (S1)	S3 (S2)	S5 (S3, S4)

Table 2. Occurrence (presence/absence) of community/association types with State Rank of 3 and less as well as total number of types, both sampled and sampled plus probable (P) tabulated by Bureau of Land Management District and Resource Area (R.A.)

State Rank Dist.	Butte District			Lewistown District					Miles City

Table 3. Listing of Montana counties by Bureau of Land Management Resource Area (counties occurring in multiple Resource Areas are in bold; counties with shading have no or very minimal BLM holding and were not specified for search when databases were queried)

GARNET RESOURCE AREA COUNTIES:

1. LINCOLN, 2. FLATHEAD, 3. SANDERS, 4. LAKE, 5. MINERAL, 6. MISSOULA, 7. POWELL, 8. RAVALLI, 9. GRANITE

DILLON RESOURCE AREA COUNTIES:

10. BEAVERHEAD, 11. MADISON

HEADWATERS RESOURCE AREA COUNTIES:

12. SILVERBOW, 13. DEER LODGE, 14. JEFFERSON, 15. CLARK, 16. PARK, 17. BROADWATER, 18. GALLATIN

**24. LEWIS & CLARK**

GREAT FALLS RESOURCE AREA COUNTIES:

19. GLACIER, 20. TOOLE, 21. LIBERTY, 22. PONDERA, 23. TETON, 24. LEWIS & CLARK, 25. CASCADE, 26. MEAGHER, 27. CHOUTEAU

JUDITH RESOURCE AREA COUNTIES:

28. JUDITH BASIN, 29. FERGUS, 30. PETROLEUM, 31. GOLDEN VALLEY, 27. CHOUTEAU

HAVRE RESOURCE AREA COUNTIES:

32. HILL, 33. BLAINE

PHILLIPS RESOURCE AREA COUNTIES:

34. PHILLIPS

VALLEY RESOURCE AREA COUNTIES:

**35. VALLEY**

BIG DRY RESOURCE AREA COUNTIES:

36. DANIELS, 37. SHERIDAN, 38. ROOSEVELT, 39. McCONE, 40. RICHLAND, 41. DAWSON, 42. WIBAUX, 43. GARFIELD, 44. FALLON, 45. PRAIRIE, 35. VALLEY, 47. ROSEBUD, 48. CUSTER

POWDER RIVER RESOURCE AREA COUNTIES:

46. TREASURE, 47. ROSEBUD, 48. CUSTER, 49. CARTER, 50. POWDER RIVER

BILLINGS RESOURCE AREA COUNTIES:

51. SWEETGRASS, 52. WHEATLAND, 53. GOLDEN VALLEY, 54. MUSSELSHELL, 55. STILLWATER, 56. YELLOWSTONE 57. CARBON, 58. BIG HORN
